Shipped offline augmentation raises the validation ceiling by 3.1 points;
byte-identical duplication is statistically equivalent to no duplication

Identical 49,770-update budget in all arms. Thin lines = individual seeds (n=3, paired); open circle = peak of the mean curve.
At peak: D-B = +3.07 points (paired p=0.0069); C-B = -0.05, equivalent within 1.0 mAP50-95 (TOST p=0.019).
Every arm declines 2.4-4.0 points from its peak by the fixed final checkpoint, so that registered endpoint sits in an overfit regime.
